

## Password-Based Encryption (PBEncryption)

## Tópicos

- Symmetric Algorithms and Key Generation
- Password-Based Encryption
- PBEncryption Scheme and Parameters
  - Salts + Counters
  - PBEncryption with and without parameters

## Key Generation for Symmetric Encryption

- Key Generation Problem / Key Generators
  - Allow the dynamic generation of keys (with pseudo-random properties)

Key Interface (base interface implemented and extended by all objects related to cryptographic keys, including symmetric keys (SecretKeySpec))

- Key.getAlgorithm() // algorithm for which the key is generated
- Key.getEncoded() // key encoding
- Key.getFormat() // key format

## Geração de chaves / criptografia simétrica

- javax.crypto.KeyGenerator Class (class implementing the key generator factory)
  - KeyGenerator.getInstance() // expliciting the algorithm
    - Ex: KeyGenerator generator= KeyGenerator.getInstance("AES", "BC");
  - KeyGenerator.Init() // Init. , Key Size
  - KeyGenerator.generateKey() // Generate

obj of type: javax.crypto.SecretKey

## Password-Based Encryption (PBE)

### LABs

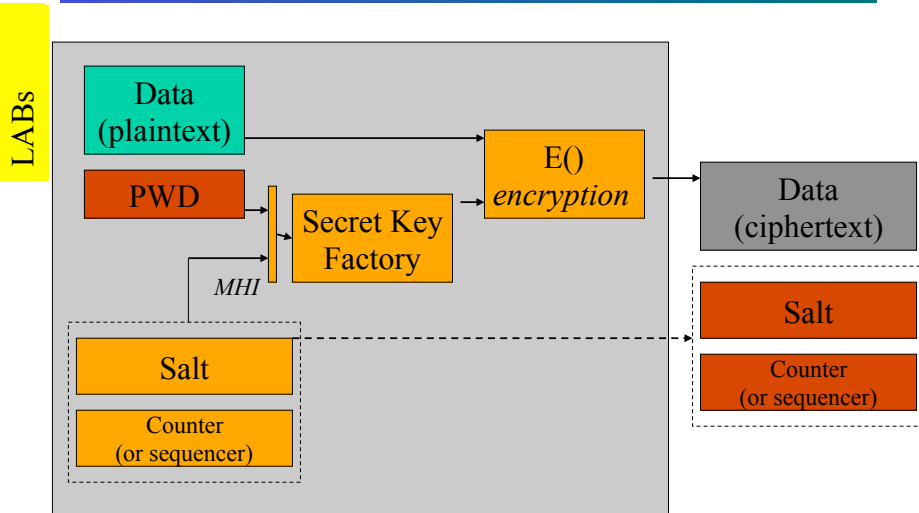

- Key Generation from "user-friendly" (passwords, or seeds)
  - "Encryption with "something" thus user Knows
- Pros: Key generated for use without the exposition of the key itself
- But ... How strong are these keys ?
  - Problem of Shared Secrets / Shared PWDs, Seeds, etc
  - Ex: A Strong Key (ex., AES 256 bits) will not be so strong if the input password is "sporting" !!!!
    - Similar to PWD dictionary Attacks !

## PB Encryption (PBE) in a Nutshell

### LABs

- Essentially a primitive to encrypt/decrypt using Passwords
  - The PWD is used as the seed to generate a Symmetric Key
  - and the generated key is implicitly used for encryption/decryption
- Standardization for PBE Schemes
  - PKCS #5, PKCS#12
  - S/MIME Scheme (RFC 3211)
- Others
  - PGP Scheme for session keys  
( using ANSI X9.17 + CAST 128 e X.12.17)

## PBE Encryption Scheme

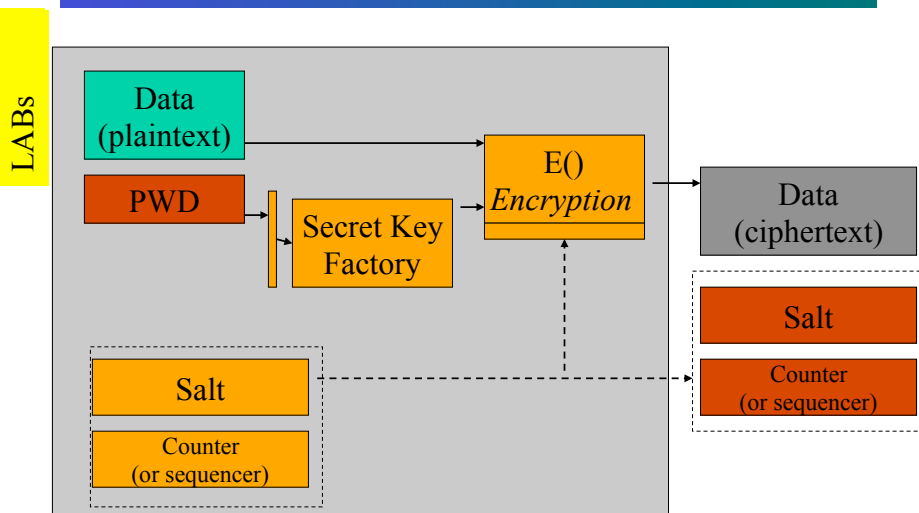

*MHI-Mixing hashing pwd input:  $PBEKeySpec(pwd, salt, cont)$*   
*Esquema de cifra sem parametros*

2016/2017, Henrique J. Domingos, © DI/FCT/UNL

Labs – PBEncryption (JCA/JCE) Slide 7

## PBE Scheme (alternative)

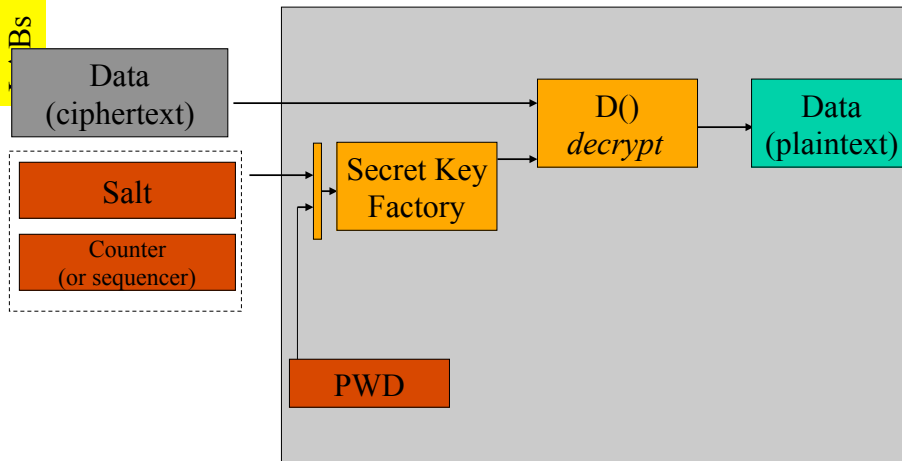

*MHI-Mixing hashing pwd input:  $PBEKeySpec(pwd)$*   
*Esquema de cifra com geração da chave final com parametros*

2016/2017, Henrique J. Domingos, © DI/FCT/UNL

Labs – PBEncryption (JCA/JCE) Slide 8

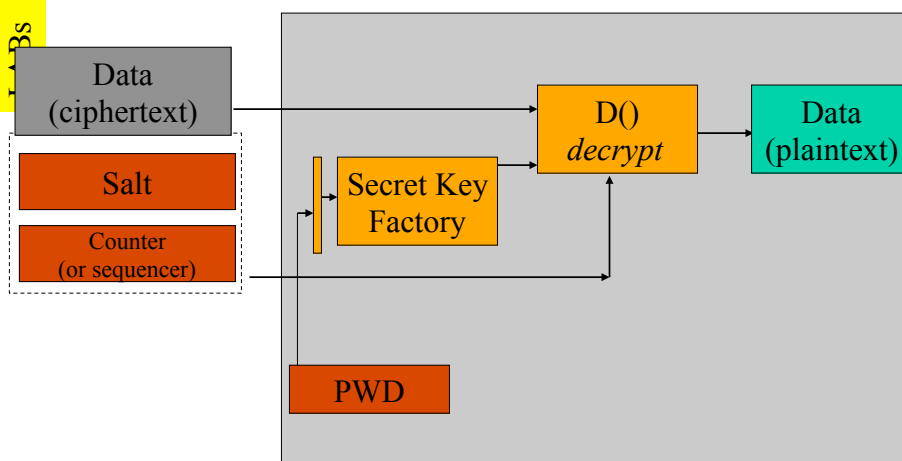

## Esquema de referência para decifra com PBE

2016/2017, Henrique J. Domingos, © DI/FCT/UNL

Labs – PBEncryption (JCA/JCE) Slide 9

## Esquema alternativo para decifra com PBE

2016/2017, Henrique J. Domingos, © DI/FCT/UNL

Labs – PBEncryption (JCA/JCE) Slide 10

## PBE na framework Java JCE

### LABs

- PBESpec, PBEKeySpec:
  - Classes for Key Generation and Parameters
- SecretKeyFactory: factory to generate symmetric Keys
- Cipher.getInstance: Instantiation of the PBE parameterization (ciphersuite) in the PBE scheme to use
- See examples
  - PBESpecExample()
  - PBEWithoutParamsExample()

## Hands-On w/ PBE Schemes

### LABs

- See the Exercises (Lab)
- See ListAlgorithms (Lab 1) and see the supported PBE Schemes in your Java Framework
